

Web Based Supply Chain Risk Assessment and Optimization

General Description:

Web based supply chain risk assessment which enables organizations to proactively optimize critical supply chain attributes, resulting in reduced risk, better quality and improved cost performance. Addresses risks usually not measured by existing supply chain enterprise systems.

What It Does:

This methodology, in practice, utilizes a web based SaaS platform called **NeuraTool™** to assess, benchmark and analyze supplier characteristics and requirements. The tool then helps analyze risks in the supply chain and in real time, manages suppliers to avoid anticipated risks.

Features:

Developed with Supply Chain Experts, DRK Research and Consulting, LLC, it provides organizations with an accurate, efficient and rapid method to analyze root causes of risk in supply chain processes and vendors and guides corrective measures to mitigate risk. The tool is low cost, secure, easy to use, and gathers input through a creative query front end. Built-in, user-friendly analysis screens provide sorted and prioritized information leading to the proactive resolution of root causes of problem areas. It is delivered via a web interface, meaning there is no IT overhead required to implement or maintain the tool. It compliments and works with other Enterprise Supply Chain Systems to provide critical information often unaccounted for by those systems.

Implementation (3 - 5 days) :

Initial set up consisting of review of supply chain process, configuration of tool for specified client base and training session for company users. Analytical consulting is available as an option. No IT resources or programming required. It operates on our secure servers.
